e-Control®2-Power Applications

Software Integration Solutions

Crestron e-Control Power Applications integrate the Crestron control network with industry-standard software solutions and programming languages. The Crestron Power Applications provide a host of sophisticated features that customers can use every day to make presentations, maintain equipment, manage network resources, and more, in easy to use touchpanel-based applications. All e-Control Power Applications run on standard 10/100BaseT networks, are license-free and require no special servers or server software.

e-Outlook
Crestron e-Outlook is a Microsoft® Outlook® add-in that allows users to access and control their Outlook calendars using Crestron touchpanels. With e-Outlook users can plan meetings, schedule videoconferences, manage rooms and tasks, and even use Microsoft Exchange Server to share calendars and appointment information—all from their Crestron touchpanel. In addition, e-Outlook can trigger up to 25 actions during any scheduled appointment, so users can activate a room's equipment for AV control, meeting presentations, or virtual conferencing simply by accessing their calendar.

e-Script
Crestron e-Script allows MIS administrators and programmers to seamlessly incorporate scripts written in various languages (Visual Basic Script, JavaScript, etc.) into the Crestron control network. Using e-Script, MIS departments can work in a familiar language and environment while still taking advantage of the power of Crestron control to:

> *Access database entries*
> *Check e-mail messages*
> *Control media applications*
> *Automate file sending to and from the control system*
> *Query network login information*
> *Act as a virtual keyboard*

The e-Script installation package comes with a database of scripts suitable for an array of applications and projects. e-Script makes it easy to configure scripts through a simple properties dialog. After being added from the database, the script can be edited and customized with any text editor.

e-Datalog
Crestron e-Datalog allows the control system to register and maintain up-to-date records on AV equipment usage, with time and date stamping of rooms, user log-ins, device power, system performance and hardware issues. With an easy-to-read graphical database powered by Microsoft Access, e-Datalog helps organizations determine equipment and purchasing needs, user activity and room usage, and to correct potential problems before they affect productivity.

e-Media Player
Crestron e-Media Player allows listeners to use Crestron touchpanels and XPanels to access, display and play back digital media files from the Media Library built into Windows Media Player® (9 Series). E-Media Player supports file formats including MP3, WAV and WMA, and displays all Media Library offerings by play list, artist, album and genre.

E-Media Player also has the ability to control and play music CDs from the CD-ROM drive on a PC, and to access any Web-based radio station that is compatible with Windows Media Player.

e-PowerPoint
Crestron e-PowerPoint allows users to preview and control PowerPoint® presentations from any Crestron touchpanel. With e-PowerPoint, the presenter can unobtrusively control all the features of the PowerPoint presentation, while the audience sees the same presentation projected on the screen. A simple icon on the touchpanel launches PowerPoint, starts the slide presentation, and controls the show with easy-to-read notes, titles, and progress indicators.

e-Dial
Crestron e-Dial is a video-conferencing solution that allows organizations to manage worldwide conference sites, contact numbers and data rates. From any PC on the LAN or WAN, conference managers can enter and update information about conferencing sites as they go online, and the information is immediately made available to all Crestron control systems on the network, for display on Crestron touchpanels. Scroll through a list of sites on the touchpanel, select a contact, and Crestron seamlessly connects the conference call.

e-Start
Crestron e-Start is a presentation solution that allows users to launch any Windows-based application from their Crestron touchpanel. With one press of a button, presenters can activate AV equipment, project an Excel spreadsheet or PowerPoint presentation on the screen, launch Internet Explorer, or start Macromedia Director for automated presentations. With e-Start, Crestron seamlessly links AV control and automation with the PC applications that organizations use every day to convey critical information in meetings and presentations.
